5 DECOMPOSITION DESCRIPTION

5.1 CORE - SIMULATION CORE

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.2 CORE - SIMULATION STATE

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.3 CORE - TASK

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.4 CORE - EVENT LIST BUILDER

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.5 CORE - PORTER

Type: Module

Purpose:

Function:

Interface:

Process Steps:**Data:****Error Handling:****Requirement Reference:****Critical Revision 0 Component:** True

5.6 CORE - DISPATCHER

Type: Module**Purpose:** To organize pending jobs based on a weighted-value and assign them to porters

Function: This module orders pending jobs based off of a Dispatch Value which is computed using several parameters (Proximity Match Value, Weighted Job Priority and Appointment Factor). The pending job with the greatest Dispatch Value will be assigned to the closest available porter. Once the job is assigned to the porter the job will be considered as a dispatched job.

Interface:

assignJob(Job)

- Assigns the job with the greatest Dispatch Value to the closest available porter.

getProximityMatchValue(Job Origin)

- Input the origin of a pending job
- Output a value based on how close an available porter is to a job's origin

getWeightedJobPriority(Job Origin, Job Destination)

- Input the origin and destination of a pending job
- Output a value based on the priority of the pending job

getAppointmentFactor(Job)

- Input a pending job
- Update the value for a job depending on if it was pre-scheduled or on-demand.

getDispatchValue(Job)

- Input a pending job
- Compute the DispatchValue for a job: $(\text{ProximityMatchValue} + \text{WeightedJobPriority} * \text{AppointmentFactor})$

updateJobPriority(Job)

- Input a pending job
- Determine if the pending job has been waiting too long. If the job has been pending for a specified amount of time, update it to a higher priority.

Process Steps: All pending jobs are assessed and given a dispatch value (DV) based on the weighting and values of specified dispatch parameters.

These weights and values are determined using either the location of an available porter or the priority of a pending job.

All of the pending jobs are then ordered from greatest dispatch value to the least. When there is an available porter the pending job with the greatest dispatch value is given to the closest porter.

Data:

- List of pending jobs

Error Handling: Not Available

Requirement Reference: Not Available

Critical Revision 0 Component: True

5.7 IMPORT - SIMULATION SETTING

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.8 IMPORT - HOSPITAL LAYOUT GRAPH

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.9 IMPORT - STATISTICAL DATA IMPORT

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.10 EXPORT - STATISTICAL DATA EXPORT

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

5.11 LOGGING

Type: Module

Purpose:

Function:

Interface:

Process Steps:

Data:

Error Handling:

Requirement Reference:

Critical Revision 0 Component: True

6 ANTICIPATED CHANGES
