

Proof of Concept

Our proof of concept will showcase a scaled down discrete event simulation model involving a few nodes representing locations in the hospital, and a few state variables representing the porters. The distribution model will be based on fake data, the real data has not yet been made available by the stakeholders. Output will be a limited, scaled down set of results corresponding to the simulation events. This proof of concept is a preliminary model designed to be scaled upwards and mapped to the full processes of the porter services. The model will include minimal User Interface elements.
